DATE MAILED: 03/08/2006				

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary	Application No.	Applicant(s)
	09/892,296	EATOUGH ET AL.
Examiner	Art Unit	
Azizul Choudhury	2145	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1) Responsive to communication(s) filed on 22 December 2005.

2a) This action is **FINAL**. 2b) This action is non-final.

3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4) Claim(s) 1-18 is/are pending in the application.
4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5) Claim(s) _____ is/are allowed.

6) Claim(s) 1-18 is/are rejected.

7) Claim(s) _____ is/are objected to.

8) Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9) The specification is objected to by the Examiner.

10) The drawing(s) filed on 26 June 2001 is/are: a) accepted or b) objected to by the Examiner.

Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11) The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
a) All b) Some * c) None of:
1. Certified copies of the priority documents have been received.
2. Certified copies of the priority documents have been received in Application No. _____.
3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

1) Notice of References Cited (PTO-892)
2) Notice of Draftsperson's Patent Drawing Review (PTO-948)
3) Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)
Paper No(s)/Mail Date _____

4) Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____
5) Notice of Informal Patent Application (PTO-152)
6) Other: _____

Detailed Action

This office action is in response to the correspondence received on December 22, 2005.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Farinacci et al (US Pat No: 5,519,704) in view of Tseung (US Pat No: 5,036,518), hereafter referred to as Farinacci and Tseung, respectively.

1. As to Claims 1, 4, and 7, Farinacci teaches through Tseung: Receiving a request to perform a task for a plurality of devices over a network (column 5, lines 50-53), wherein the task comprises copying a file, installing a software application, updating a software application or sending batch data (column 40, lines 51-66, Tseung); Performing said task using a multicast message communicated over said network (column 5, lines 55-57); Receiving a request to complete said task from at least one device (see column 5, lines 53-55); Determining whether said task was completed for said at least one device (see column 5, lines line 60-63); and Performing said task using a unicast message communicated over said network in accordance with said determination (see column 5, lines 64-67).

(While Farinacci teaches a design allowing for tasks to be performed through the use of unicast and multicast messages, Farinacci does not disclose the task being software updates and installs. In the same field of endeavor, Tseung teaches a design allowing for software installs and updates through multicasts (column 33, lines 60-62 and column 40, lines 51-66, Tseung). The disclosure also teaches how one-to-one (unicast) data transfers are allowed (column 1, lines 25-58 and column 40, lines 31-51, Tseung). Therefore, it would have been obvious to one skilled in the art, during the time of the invention, to have combined the teachings of Farinacci with those of Tseung to allow software and/or updates to be sent using the guaranteed, reliable and secure one-to-many technique (column 40, lines 51-54, Tseung)).

2. As to Claims 2, 5 and 13, Farinacci teaches through Tseung: Wherein said determining whether said task was completed for said at least one device comprises: Receiving an identifier for said at least one device; Searching a task status table using said identifier; Retrieving a status indicator associated with said identifier; and Determining whether said task was completed for said at least one device using said status indicator (see column 2, lines 57-63).

(While Farinacci teaches a design allowing for tasks to be performed through the use of unicast and multicast messages, Farinacci does not disclose the task being software updates and installs. In the same field of endeavor, Tseung teaches a design allowing for software installs and updates through multicasts

(column 33, lines 60-62 and column 40, lines 51-66, Tseung). The disclosure also teaches how one-to-one (unicast) data transfers are allowed (column 1, lines 25-58 and column 40, lines 31-51, Tseung). Therefore, it would have been obvious to one skilled in the art, during the time of the invention, to have combined the teachings of Farinacci with those of Tseung to allow software and/or updates to be sent using the guaranteed, reliable and secure one-to-many technique (column 40, lines 51-54, Tseung)).

3. As to Claims 3, 6, 8, and 11, Farinacci teaches through Tseung: Wherein said receiving said request to complete said task from at least one device comprises: Determining whether said at least one device is in communication with said network; and Sending said request to complete said task from said at least one device (see column 53-55).

(While Farinacci teaches a design allowing for tasks to be performed through the use of unicast and multicast messages, Farinacci does not disclose the task being software updates and installs. In the same field of endeavor, Tseung teaches a design allowing for software installs and updates through multicasts (column 33, lines 60-62 and column 40, lines 51-66, Tseung). The disclosure also teaches how one-to-one (unicast) data transfers are allowed (column 1, lines 25-58 and column 40, lines 31-51, Tseung). Therefore, it would have been obvious to one skilled in the art, during the time of the invention, to have combined the teachings of Farinacci with those of Tseung to allow software

and/or updates to be sent using the guaranteed, reliable and secure one-to-many technique (column 40, lines 51-54, Tseung)).

4. As to Claim 9, Farinacci teaches through Tseung: A storage medium: Said storage medium including stored instructions that, when executed by a processor, result in receiving a request to perform a task for a plurality of devices over a network (see column 5, lines 50-53), performing said task using a multicast message communicated over said network (see column 5, lines 55-57), receiving a request to complete said task from at least one device (see column 5, lines 53-55), determining whether said task was completed for said at least one device, and performing said task using a unicast message communicated over said network in accordance with said determination (see column 5, lines 60-67), wherein the task comprises copying a file, installing a software application, updating a software application or sending batch data (column 40, lines 31-66, Tseung)).

(While Farinacci teaches a design allowing for tasks to be performed through the use of unicast and multicast messages, Farinacci does not disclose the task being software updates and installs. In the same field of endeavor, Tseung teaches a design allowing for software installs and updates through multicasts (column 33, lines 60-62 and column 40, lines 51-66, Tseung). The disclosure also teaches how one-to-one (unicast) data transfers are allowed (column 1, lines 25-58 and column 40, lines 31-51, Tseung). Therefore, it would have been

obvious to one skilled in the art, during the time of the invention, to have combined the teachings of Farinacci with those of Tseung to allow software and/or updates to be sent using the guaranteed, reliable and secure one-to-many technique (column 40, lines 51-54, Tseung)).

5. As to Claim 10, Farinacci teaches through Tseung: Wherein the stored instructions, when executed by a processor, further result in determining whether said task was completed for said at least one device by receiving an identifier for said at least one device, searching a task status table using said identifier, retrieving a status indicator associated with said identifier, and determining whether said task was completed for said at least one device using said status indicator (see column 2, lines 57-63).

(While Farinacci teaches a design allowing for tasks to be performed through the use of unicast and multicast messages, Farinacci does not disclose the task being software updates and installs. In the same field of endeavor, Tseung teaches a design allowing for software installs and updates through multicasts (column 33, lines 60-62 and column 40, lines 51-66, Tseung). The disclosure also teaches how one-to-one (unicast) data transfers are allowed (column 1, lines 25-58 and column 40, lines 31-51, Tseung). Therefore, it would have been obvious to one skilled in the art, during the time of the invention, to have combined the teachings of Farinacci with those of Tseung to allow software

and/or updates to be sent using the guaranteed, reliable and secure one-to-many technique (column 40, lines 51-54, Tseung)).

6. As to Claim 12, Farinacci teaches through Tseung: A storage medium; Said storage medium including stored instructions that, when executed by a processor, result in receiving a request to send information to a plurality of devices (see column 5, lines 50-53), sending said information to said plurality of devices using a broadcast message (see column 5, lines 55-57), receiving a request for said information from at least one device (see column 5, lines 53-55), determining whether said at least one device received said information, and sending said information to said at least one device using a unicast message in accordance with said determination (see column 5, lines 60-67).

(While Farinacci teaches a design allowing for tasks to be performed through the use of unicast and multicast messages, Farinacci does not disclose the task being software updates and installs. In the same field of endeavor, Tseung teaches a design allowing for software installs and updates through multicasts (column 33, lines 60-62 and column 40, lines 51-66, Tseung). The disclosure also teaches how one-to-one (unicast) data transfers are allowed (column 1, lines 25-58 and column 40, lines 31-51, Tseung). Therefore, it would have been obvious to one skilled in the art, during the time of the invention, to have combined the teachings of Farinacci with those of Tseung to allow software

and/or updates to be sent using the guaranteed, reliable and secure one-to-many technique (column 40, lines 51-54, Tseung)).

7. As to Claim 14, Farinacci teaches through Tseung: Wherein the stored instructions, when executed by a processor, further result in receiving a request for said information by connecting said at least one device to said network and sending said request for said information from said at least one device (see column 5, lines 60-67).

(While Farinacci teaches a design allowing for tasks to be performed through the use of unicast and multicast messages, Farinacci does not disclose the task being software updates and installs. In the same field of endeavor, Tseung teaches a design allowing for software installs and updates through multicasts (column 33, lines 60-62 and column 40, lines 51-66, Tseung). The disclosure also teaches how one-to-one (unicast) data transfers are allowed (column 1, lines 25-58 and column 40, lines 31-51, Tseung). Therefore, it would have been obvious to one skilled in the art, during the time of the invention, to have combined the teachings of Farinacci with those of Tseung to allow software and/or updates to be sent using the guaranteed, reliable and secure one-to-many technique (column 40, lines 51-54, Tseung)).

8. As to Claim 15, Farinacci teaches through Tseung: A storage medium; said storage medium including stored instructions that, when executed by a

processor, result in receiving a request to perform a task for a plurality of devices over a network (see column 5, lines 50-53), performing said task using a multicast message communicated over said network (see column 5, lines 55-57), receiving a request to complete said task from at least one device and an identifier for said at least one device (see column 53-55), searching a task status table using said identifier, retrieving a status indicator associated with said identifier, determining whether said task was completed for said at least one device using said status indicator (see column 2, lines 57-63), and performing said task using a unicast message communicated over said network in accordance with said determination (see column 5, lines 60-67), wherein the task comprises copying a file, installing a software application, updating a software application or sending batch data (column 40, lines 31-66, Tseung).

(While Farinacci teaches a design allowing for tasks to be performed through the use of unicast and multicast messages, Farinacci does not disclose the task being software updates and installs. In the same field of endeavor, Tseung teaches a design allowing for software installs and updates through multicasts (column 33, lines 60-62 and column 40, lines 51-66, Tseung). The disclosure also teaches how one-to-one (unicast) data transfers are allowed (column 1, lines 25-58 and column 40, lines 31-51, Tseung). Therefore, it would have been obvious to one skilled in the art, during the time of the invention, to have combined the teachings of Farinacci with those of Tseung to allow software

and/or updates to be sent using the guaranteed, reliable and secure one-to-many technique (column 40, lines 51-54, Tseung)).

9. As to Claim 16, Farinacci teaches through Tseung: Wherein the stored instructions, when executed by a processor, further result in receiving said request to complete said task from at least one device by connecting said at least one device to said network, and sending said request to complete said task from said at least one device (see column 5, lines 60-67).

(While Farinacci teaches a design allowing for tasks to be performed through the use of unicast and multicast messages, Farinacci does not disclose the task being software updates and installs. In the same field of endeavor, Tseung teaches a design allowing for software installs and updates through multicasts (column 33, lines 60-62 and column 40, lines 51-66, Tseung). The disclosure also teaches how one-to-one (unicast) data transfers are allowed (column 1, lines 25-58 and column 40, lines 31-51, Tseung). Therefore, it would have been obvious to one skilled in the art, during the time of the invention, to have combined the teachings of Farinacci with those of Tseung to allow software and/or updates to be sent using the guaranteed, reliable and secure one-to-many technique (column 40, lines 51-54, Tseung)).

10. As to Claim 17, Farinacci teaches through Tseung: A server, said server having a task handler module to manage complete of a task for a plurality of target

devices using a multicast message, wherein the task comprises copying a file, installing a software application, updating a software application or sending batch data (column 40, lines 51-66, Tseung); a plurality of target devices, said plurality of target devices each having a task finisher module to request completion of said task if uncompleted; and A network to communicate information between said server and said plurality of target devices to complete said task (see column 4, lines 40-47).

(While Farinacci teaches a design allowing for tasks to be performed through the use of unicast and multicast messages, Farinacci does not disclose the task being software updates and installs. In the same field of endeavor, Tseung teaches a design allowing for software installs and updates through multicasts (column 33, lines 60-62 and column 40, lines 51-66, Tseung). The disclosure also teaches how one-to-one (unicast) data transfers are allowed (column 1, lines 25-58 and column 40, lines 31-51, Tseung). Therefore, it would have been obvious to one skilled in the art, during the time of the invention, to have combined the teachings of Farinacci with those of Tseung to allow software and/or updates to be sent using the guaranteed, reliable and secure one-to-many technique (column 40, lines 51-54, Tseung)).

11. As to Claim 18, Farinacci teaches through Tseung: Further comprising a task handler module for each of said plurality of target devices to complete said task for said plurality of target devices (see column 4, lines 40-47).

(While Farinacci teaches a design allowing for tasks to be performed through the use of unicast and multicast messages, Farinacci does not disclose the task being software updates and installs. In the same field of endeavor, Tseung teaches a design allowing for software installs and updates through multicasts (column 33, lines 60-62 and column 40, lines 51-66, Tseung). The disclosure also teaches how one-to-one (unicast) data transfers are allowed (column 1, lines 25-58 and column 40, lines 31-51, Tseung). Therefore, it would have been obvious to one skilled in the art, during the time of the invention, to have combined the teachings of Farinacci with those of Tseung to allow software and/or updates to be sent using the guaranteed, reliable and secure one-to-many technique (column 40, lines 51-54, Tseung)).

Response to Remarks

The amendment received on December 22, 2005 has been carefully examined but is not deemed fully persuasive. The amendment features amendments implemented on the independent claims. The independent claims now feature software install/updates on multicast or unicast networks. The claimed feature is not disclosed on the original prior art and hence a new search was performed. In the same field of endeavor, Tseung was found to teach the install/update of software on one-to-one (unicast) networks and one-to-many (multicast) networks.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Azizul Choudhury whose telephone number is (571) 272-3909. The examiner can normally be reached on M-F.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Jason Cardone can be reached on (571) 272-3933. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
